Early Alerts

Powered by proven analytics from historical student data, **Early Alerts help instructors identify struggling students even if their homework scores may not suggest concern.** Now available, this evolving feature provides instructors with valuable insights into students comprehension, using scores and activity metrics to inform when intervention may be needed.

Working behind the scenes, our patented Early Alerts algorithm analyzes six data factors that reveal which students may be at risk.

The Early Alerts' **Course Summary** view, provides a high level look at the risk levels across the class and shows weekly trends.

The **Student List** view shows each students' current risk level, risk history, exercise performance and the ability to email students directly. Early Alerts empowers instructors to offer help.

Early Alerts helps identify a potential invisible student population and take action before it is too late.
